

In cities with and without major ports, from Hamburg to Lisbon, from Paris to Barcelona, from Berlin to Los Angeles, from Barranquilla to Havana, from Durban to Dublin, port professionals and scholars from multiple disciplines have gathered to discuss port cities over the last three years [1]. The topic is not new, but the high number of events signals increased interest. So far, these conferences, sessions and workshops mostly fall into two categories: those organized by professionals of ports and technology who seek to improve the functionality of the port and academics from social science and humanities fields who explore a broad range of port city-related developments. Despite the difference in attendees' backgrounds and purposes, two commonalities stand out: First, both explore interrelation of port and city; second, a new and strong interest in history on the side of the port developers matches an increase of history-oriented events among academics. The proliferation of events raises the question: Are there novel opportunities for collaboration among different fields and approaches?

Port Authorities, maritime logistics, technology companies, and engineering departments at major universities have long studied port efficiency, safety, and energy. As the discussions in their conferences show, they see the need for both an integrated approach towards port and city and historical awareness. This is particularly well demonstrated in a publication on the "Competitiveness of Port Cities", launched at a conference of the Organisation for Economic Co-operation and Development (OECD) in 2013 and published in 2014 [2]. The publication acknowledges positive effects of the port spill over to locations beyond the city, while most of the negative effects are concentrated in the port-city, and it asks how negative port impacts can be mitigated. In the first sentence of its introduction, the publication specifically brings up the past, describing a historical shift: "Ports and cities are historically strongly linked, but the link between port and city growth has become weaker" [3]. The references to the integration of port and city and its historic evolution are striking, but not unique. Professional institutions, port authorities, and governments have opted for some time to collaborate with each other more closely to foster regional visions and large-scale planning - that is, planning that takes into account more than the functionality of the port. Institutions such as the Association Internationale Ville et Ports (AIVP), also shape research and collaborations through their conferences and publications and have addressed the changing relationship of port and city over the last 25 years [4]. Port authorities are thus in search of an integrated approach to improve the relation between port and city and for further engagement with historical information elements that academics may be able to offer.

As professional conferences engage with territories beyond the port, and times beyond the present and future, scholars from the social sciences and humanities employ innovative ways to research port cities, stressing the multiple social, political, and cultural aspects of port cities in addition to their economic role. Perhaps most striking in the multitude of conferences is the boom of events explicitly focused on the history of port cities. Five out of 51 sessions at the meeting of the European Association of Urban Historians in Lisbon in 2014 explored themes of port cities [5].

Even more strikingly, the World History Association (WHA) discussed port cities in world history in a dedicated symposium in 2014 [6]. Some 60 scholars convened to discuss social and cultural aspects that are largely absent or only discussed in passing in the professional conferences. The geographical range was broad, with an astounding number of papers on Asian ports and Spanish colonial networks. Specific topics included issues such as crime and lawlessness, issues of piracy, commerce, colonialism and colonial empires, multi-ethnic communities, ports as information centres, and ports and culture – all themes that are

highly topical. These studies on issues of migration, ethnicity, and identity (or image construction) complement the scope of the port professionals in their attempt to connect port and city.

So far, the two groups have pursued their interests independently, for the most part. But their simultaneous interest in the multiple facets of port and city interaction and into their longer history may provide an incentive to push the two areas to integrate their research perspectives, specifically inciting the port professionals to increase collaboration with social scientists and humanists, including historians who taken a broader and more critical perspective towards port and city development. The study of port cities can also provide a framework for collaborative and comparative research in the humanities and social sciences; many more conferences will offer opportunities for new investigations. Collective efforts would benefit both the study of port cities and port cities themselves.
